INTERNAL TOOL · CHROME EXTENSION

Nunjucks CMS Formatter

Format, test-render, and hear GVA response templates before they ship — synced live with the CMS field you're already editing.

WHY THIS EXISTS

The Response Text field on the CMS is a plain, unformatted textarea — **no syntax highlighting, no way to render it against sample data, no output preview.** Dense templates with nested `{% if %}` blocks and SSML tags are easy to get wrong and hard to catch before publishing. This extension opens a side panel next to that field with three synced views so you can catch a broken template before it goes live.

WHAT YOU GET

01 — CODE EDITOR

Formatted & highlighted

Two-way synced with the CMS field — edit in either place, the other updates.

02 — TEST DATA

Auto-generated

Starts pre-filled from the template's own fields. Edit freely, or reset with one click.

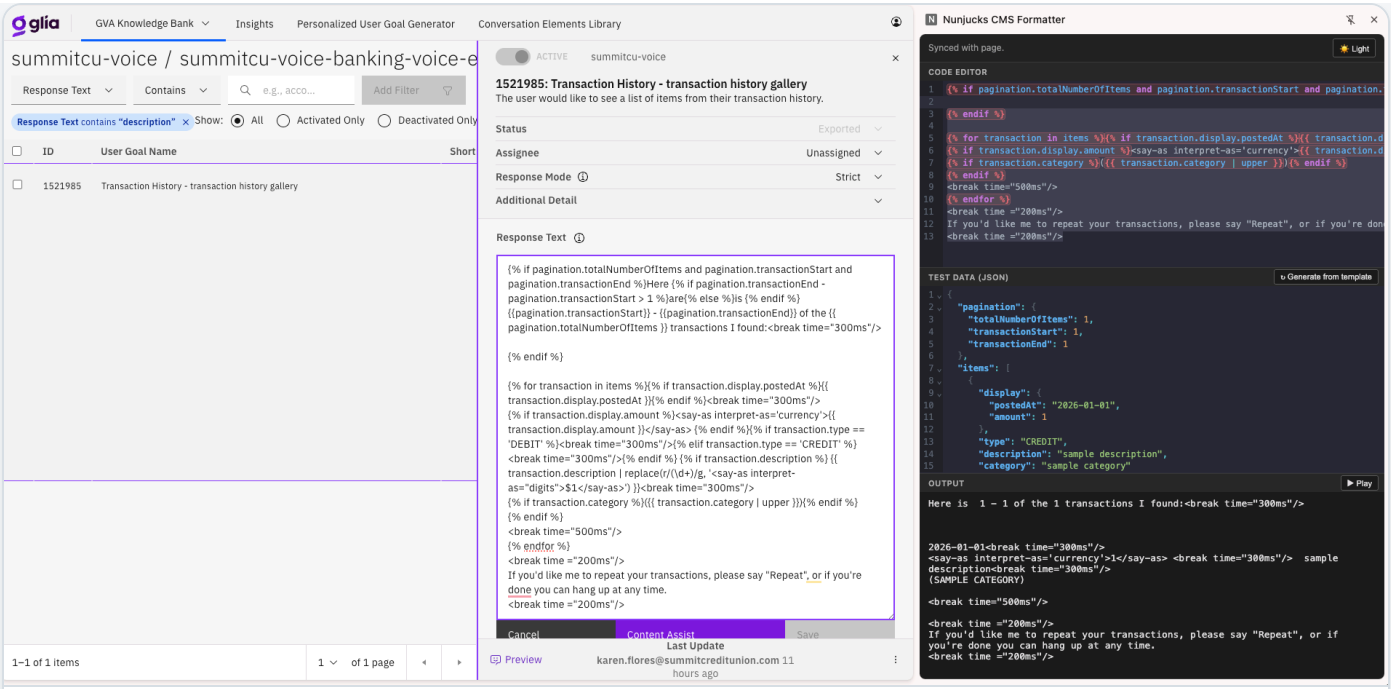

03 — OUTPUT

Real render + play

Actual Nunjucks output, plus a rough spoken read-through.

SEE IT IN ACTION

The side panel (right) synced live with a real Response Text field (left) — Code Editor, auto-generated Test Data, and the rendered Output, all in one view.

Transaction History response template — synced, formatted, and rendered against auto-generated test data.

SETUP — 5 MINUTES

1. Get the extension folder (`dist`) from the link you were sent, and unzip it if it arrived as a `.zip` .

2. Open `chrome://extensions` in Chrome.

3. Turn on **Developer mode** (top-right toggle).

4. Click **Load unpacked** and select the `dist` folder.

   No install prompt, no store listing — Chrome loads it straight from the folder.

5. Click the puzzle-piece icon in the toolbar and **pin** the extension so it's always visible.

6. Go to `portal.finn.ai/cms` and open any response with a Response Text field.

   Tab was already open before you loaded the extension? Refresh it once — content scripts only attach to tabs opened after install.

7. Click the toolbar icon to open the side panel. It should sync with the field automatically.

USING IT

↻ Generate from template	In the Test Data pane — rebuilds a fresh data skeleton from whatever's currently in the Code Editor, overwriting the box.
▶ Play	Reads the Output aloud with the browser's built-in voice — pauses on `<break>` tags, spells out digit strings. A quick sanity check, not production-accurate audio.
🌙 / ☀️ theme	Top-right toggle. Your choice is remembered — it won't reset next time you open the panel.

IF IT'S NOT SYNCING

```
// panel says "no content script loaded"
1. refresh the CMS tab
2. reopen the side panel
// still stuck? check chrome://extensions for a red error badge
```

GOOD TO KNOW

- Only the Response Text field is supported right now — other CMS fields won't sync.
- The Play button approximates SSML with the browser's own voice; it won't sound like the real voice channel (that likely uses Amazon Polly).
- This isn't published to the Chrome Web Store, so updates don't happen automatically — when a new version goes out, re-download and reload it the same way.

Questions or bugs — just ask.
